

What happens to salvage material after a house demolition?

1. Assessment and Sorting:

After a house is demolished, salvageable materials like wood, metal, bricks, and fixtures are carefully assessed and sorted. This step helps determine what can be reused, recycled, or repurposed.

2. Reclamation:

Salvageable items such as doors, windows, flooring, cabinets, and even architectural features like mouldings or fireplace mantels are reclaimed. They can either be sold directly to individuals or salvaged material companies, or they might be donated to organisations like Habitat for Humanity.

3. Recycling:

Materials like concrete, bricks, and metal are recycled. Concrete and bricks can be crushed and reused as aggregate for new construction projects, while metals are melted down and turned into new products.

4. Environmental Considerations:

Throughout this process, environmental considerations are paramount. Proper disposal of hazardous materials like asbestos or lead-based paint is crucial to ensure the safety of workers and the environment.

5. Landfill Disposal:

Unfortunately, not all materials can be salvaged or recycled. Some non-recyclable materials end up in landfills. However, efforts are made to minimise landfill waste as much as possible through responsible disposal practices.

Overall, the goal of managing salvage material following a house demolition is to maximise reuse and recycling, minimise waste sent to landfills, and ensure responsible environmental stewardship.
